

# LEED Points: The Untapped Category Credit

*Up to 21 incremental LEED points from one system. No other retrofit does this.*

---

## At a Glance

Up to 21 incremental LEED points from one integrated system. No other retrofit achieves this density. Category credits across Energy and Atmosphere, Indoor Environmental Quality, Sustainable Sites simultaneously.

## Summary

LEED credits cluster across three scoring categories: Energy and Atmosphere (improved HVAC efficiency, reduced energy measurably), Indoor Environmental Quality (plants improve air quality humidity thermal comfort), Sustainable Sites (reduced urban heat island effect). Single Thermopod™ deployment addresses all three simultaneously. Most HVAC retrofits earn two to three points total. Biothermal Microconditioning densifies credit capture because inherently multidisciplinary: cooling efficiency, improved ventilation, natural daylighting, biophilic design. For LEED-targeting projects, this represents missing category in architect's toolkit. First firms specifying Biothermal Microconditioning as compliance service will bill for it. LEED certification becomes faster and cheaper to achieve.
